

ADDENDUM NO. 2 TO RFP NO. JTD-565939, dated 3/28/03

- Q. What will be the minimum and average number of stars in each 1 degree field, and is there any virtue in looking at more than the minimum number?
- A. Typically, there will be 4 target stars grouped together which are located within a single square degree field of view. However, there may be certain regions of the sky where there are more (or less) than 4 stars grouped together. In general, we are only interested in those stars contracted by the Grid star RFP. Other stars in the square degree field are not necessarily of interest to the project.
